Sequence 16, Application US/09912628
Patent No. US20020160491A1
GENERAL INFORMATION:
APPLICANT: Ni et al.
TITLE OF INVENTION: Human Serpin Polynucleotides, Polypeptides, and Antibodies
FILE REFERENCE: PT001P2
CURRENT APPLICATION NUMBER: US/09/912,628
CURRENT FILING DATE: 2001-07-26
PRIOR APPLICATION NUMBER: PCT/US01/02484
PRIOR FILING DATE: 2001-01-26

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The invention comprises the amino acid and coding sequences of a group of movel human serine protease inhibitors (serpins). Serpins are a superfamily of single chain proteins that contain a conserved structure of approximately 370-420 amino acids and generally range between 50 and 100 kbm in molecular mass. The majority of serpins function as protease activated physiological processes (e.g. blood coagulation of several proteins on the analy and amino acid sequences of the invention are useful in the treatment (e.g. gene therapy, antisense therapy) and diagnosis of conditions such as cancer, inflammation, neurological diseases and immune diseases. The present amino acid sequence represents a human serpin protein of the
                                                                                                                                                                                                                                                                                                                                                                                                                          Isolated serine protease inhibitor polypeptide for treating, preventing and/ or prognosing cancers, inflammation, immune disorders and neurological diseases and also for testing and detection e.g. diagnosis

                                                                                                                                                                                                                                                                                                   The present sequence represents a human serpin polypeptide. Serpin is a member of the serine protease inhibitor superfamily of polypeptides. The serpin polymucleotides and polypeptides are used to prevent, treat or ameliorate a medical conditions in e.g. humans, mice, rabbits, goats, corses, cats, dogs, chickens or sheep. Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cerebrovascular disorders e.g. cerebrovascular disorders e.g. nervous system disorders, e.g. Alzheimer's disease, infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to rangelantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotraxis. The polypeptides can also be used to aid diditive or preservative to increase or decrease storage

The present sequence represents a human serpin polypeptide. Serpin is a member of the serine protease inhibitor superfamily of polypeptides. The serpin polymucleotides and polypeptides are used to prevent, treat or ameliorate a medical conditions in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. Disorders which are disgnosed or treated include autorimmum diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. neoplasms of the breast or liver. Cardiovascular ischemia, anglogenesis, nervous system disorders. e.g. cerebral ischemia, anglogenesis, nervous system disorders. e.g. Alzheimer's disease, infections caused by bacteria, viruses and slong and ocular disorders e.g. corneal infection. The polypeptides can also be used to aid wound healing and epithelial call proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage
Human, serpin, serine protease inhibitor; autoimmune disease; neoplasm; rheumaroid arthritis; hyperproliferative disorder; cerebral ischemia; cardiovascular disorder; cardiac arrest; cerebrovascular disorder; angiogenesis; nervous system disorder; Alzheimer's disease; infection; occular disorder; sorner infection; epithelial cell proliferation; skin aging; sumburn; wound healing; organ transplantation; chemotaxis; food additive; food preservative.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel human serine protease inhibitor superfamily of proteins useful for diagnosing, treating, preventing and/or prognosing disorders related to the Serpin polypeptides

The invention comprises the amino acid and coding sequences of a group of movel human serine processe inhibitors (serpins). Serpins are a superfamily of single chain proteins that contain a conserved structure of approximately 370-420 amino acids and generally range between 50 and into kDa in molecular mass. The majority of serpins function as protease activated physiological processes (e.g. blood cosquiation). The Serpin DNA and amino acid sequences of the invention are useful in the treatment (e.g. gene therapy, antilesse therapy) and disponsis of conditions such as cancer, inflammation, neurological diseases and immune diseases. The present amino acid sequence represents a human serpin protein of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Isolated serine protease inhibitor polypeptide for treating, preventing and/ or prognosing cancers, inflammation, immune disorders and neurological diseases and also for testing and detection e.g. diagnosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        LIFFPMSISSALAMVFMGAKGNTAAQMSQALCFSKIGGEDGDIHRGFQSLLVAINRTDTE 102

Serpin is a member of the serine protease inhibitor superfamily of polypeptides. The serpin polynoclatical and polypeptides are used to prevent, treat or ameliorate a medical conditions in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, chyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, nervous system disorders.

C. e.g. Alzheimer's disorders e.g. corneal infection. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to responsate tissues, to transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used
                                                                                                                                                                                                                                                                                                Human; serpin; serine protease inhibitor; autoimmune disease; neoplasm; rheumatoid arthritis; hyperproliferative disorder; cerebral ischemia; cardiovascular disorder; cardiac arrest; cerebrovascular disorder; angiogenesis; nervous system disorder; Alzheimar's disease; infection; ocular disorder; corneal infection; epithelial cell proliferation; skin aging; sunburn; wound healing; organ transplantation; chemotaxis; food additive; food preservative.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel human serine protease inhibitor superfamily of proteins useful for diagnosing, treating, preventing and/or prognosing disorders related to the Serpin polypeptides

The invention comprises the amino acid and coding sequences of a group of novel human serine procease inhibitors (serpins). Serpins are a superfamily of single chain proteins that contain a conserved structure of approximately 370-420 amino acids and generally range between 50 and 100 kDa in molecular mass. The majority of serpins function as procease activated physiological processes (e.g. blood coagulation). The Serpin DNA and amino acid sequences of the invention are useful in the treatment (e.g. gene therapy, antisense therapy) and diagnosis of conditions such as cancer, inflammation, neurological diseases and immune diseases. The
Isolated serine protease inhibitor polypeptide for treating, preventing and or prognosing cancers, inflammation, immune disorders and neurological diseases and also for testing and detection e.g. diagnosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                         present amino acid sequence represents a human serpin protein of

```
The present sequence represents a human serpin polypeptide. Serpin is a member of the serine protease inhibitor superfamily of polypeptides. The serpin polynucleotides and polypeptides are used to prevent, treat or ameliorate a medical conditions in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. neoplesms of the breast or liver, cardiovascular disorders e.g. cardiac artrest, cerebrovascular disorders e.g. cardiac artrest, cerebrovascular disorders e.g. corneal infection. The polypeptides and fungi and ocular disorders e.g. corneal infection. The polypeptides can consider a skin aging due to subburn, to maintain organs before to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used converted to increase or decrease storage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ä

Human novel polypeptide #78.

(first entry)

30-AUG-2002

ABG66743

```
The invention comprises the amino acid and coding sequences of a group of novel human serine protease inhibitors (serpins). Serpins are a superfamily of single chain proteins that contain a conserved structure of approximately 370-420 amino acids and generally range between 50 and 100 kDa in molecular mass. The majority of serpins function as protease activated physiological processes (e.g. blood coagulation). The Serpin DNA and amino acid sequences of the invention are useful in the treatment (e.g. green therapy, antisense therapy) and diagnosis of conditions such as cancer, inflammation, neurological diseases and immune diseases. The present amino acid sequence represents a human serpin protein of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Isolated serine protease inhibitor polypeptide for treating, preventing and/ or prognosing cancers, inflammation, immune disorders and neurological diseases and also for testing and detection e.g. diagnosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         KARGKQLKQLIFFP---MSISSALAMVFMGAKGNTAAQMSQALCFSKIGGEDGDIHRGFQ

The invention relates to human novel polymucleotides and associated conjugations. The polymucleotides and polymeptides are useful for treating inflammatory conditions such as arthritis, nephritis, Crohn's treating inflammatory conditions such as arthritis, nephritis, Crohn's conditions such as arthritis, nephritis, Crohn's and cancer and for promoting wound healing. The sequences are used to induce the proliferation of neural cells and regeneration of nerve and control intissue, and are useful for the treatment of central and peripheral nervous system diseases and neuropathies, such as Alzheimer's disease, parkinson's disease, Huntington's disease and amyotrophic lateral cell visions. The sequences are involved in chemotactic or chemokinetic activity, regulation of heamatopoieds, treatment of myeloid or lymphoid cell disorders and platelet disorders such as thrombocytopenia, cell resemention of bone, cartilage, tendon, ligament and/or nerve tissue cregeneration of bone, cartilage, tendon, ligament and/or nerve tissue cregeneration of bone, cartilage, tendon, ligament and/or nerve tissue cregeneration or tegeneration and treatment of lung or liver fibrosis, ortocettion or regeneration and treatment of lung or liver fibrosis, repetitision injury in various tissues, immune deficiencies and disorders confidency severe combined immunodeficiency (SCID), bacterial or fungal including severe combined immunodeficiency (SCID), bacterial or fungal inflections, autoimmune disorders egg multiple sclerosis and mysathenia conditions such as asthma, thrombolysis or thrombosis
                                                                                                                                                      cancer, wound healing; central nervous system disease; haematopoiesis; peripheral nervous system disease; amyotrophic lateral sclerosis; tendon; myeloid cell disorder; lymphoid cell disorder; bone; cartilage; ligament; nerve tissue; ulcer; osteoporosis; osteoarthritis; bone degenerative disorder; periodontal disease; reperfusion injury; lung fibrosis; liver fibrosis; autoimmune disorder; bacterial infection; allergic condition; thrombolysis; thrombosis; coagulation disorder;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel nucleic acids and polypeptides for diagnosis, treatment of inflammatory, autoimmune, nervous system, myeloid or lymphoid cell disorders, cancer and promoting wound healing -

abnormality such as deep vein thrombosis.

셤 ઠે 요 ઠે 8

```
The sequence represents an angiotenain converting enzyme splice variant (ACEV) polypeptide. The polypeptides of the invention include variants of granulocyte colony stimulating factor receptor, glucagon, interleukin 6, platelet-derived endothelial cell growth factor, cyclin-dependent kinase inhibitor 1C, cellular tumour antigen P53, and vasoactive intestinal colypeptide receptor 2. The polypeptides and their associated nucleic acids are useful for identification of variant sequences and detection of the invention can be used in the treatment and diagnosis of various discrets including cardiovascular diseases such as arteriosclerosis, myocardial infarction and coronary arterial thrombosis, renal diseases can be an disease such as hypertrophy, immune diseases such as hypertrophy, immune diseases such as hypertrophy, immune diseases such as immune complex nephritis, multiple sclerosis, cancer, sarcoidosis, nonarcoidotic pulmonary granulomatous diseases such as asbestosis and vascular pathologies involving an endothelial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Angiotensin converting enzyme splice variant; ACEV; interleukin 6; granulocyte colony stimulating factor receptor; glucagon; hypertrophy; platelet-derived endothelial cell growth factor; cardiovascular disease; cellular tumour antigen P53; cyclin-dependent kinese inhibitor IC; wasoactive intestinal polypeptide receptor 2; arteriosclerosis; cancer; myocardial infarction; coronary arterial thrombosis; renal disease; diabetic nephropathy; muscular disease; immune disorder; sarcoidosis; multiple sclerosis; immune complex nephritis; deep vein thrombosis; nonarcoidotic pulmonary granulomatous disease; endothelial abnormality;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel alternative splicing variants e.g. variant of angiotensin converting enzyme (ACEV), useful in identifying candidate compounds capable of binding to the variant and to detect anti-variant antibodies
                                                                                                                                162

Angiotensin converting enzyme splice variant; ACEV; interleukin 6; granulocyte colony stimulating factor receptor; glucagon; hypertrophy; platelet-derived endothelial cell growth factor; cardiovascular disease; cellular tumour antigen PS3; cyclin-dependent kinase inhibitor 1C; vasoactive intestinal polypeptide receptor 2; arteriosclerosis; cancer; myocardial infarction; coronary arterial thrombosis; renal disease; dabetic nephropathy; muscular disease; immune disorder; sarcoidosis; nultiple sclerosis; immune complex nephritis; deep vein thrombosis; nonarcoidotic pulmonary granulomatous disease; endothelial abnormality; vascular disorder; asbestosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequence represents an angiotensin converting enzyme splice variant (ACEV) polypeptide. The polypeptides of the invention include variants of granulocyte colony stimulating factor receptor, glucagon, interleukin 6, platelet-derived endothelial cell growth factor, cyclin-dependent kinase inhibitor IC, cellular tumour antigen P53, and vasoactive intestinal polypeptide receptor 2. The polypeptides and their associated nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel alternative splicing variants e.g. variant of angiotensin converting enzyme (ACEV), useful in identifying candidate compounds capable of binding to the variant and to detect anti-variant antibodies

acids are useful for identification of variant sequences and detection of candidate compounds capable of binding the molecules. The sequences of the invention can be used in the treatment and diagnosis of various disorders including cardiovascular diseases such as arteriosslessench as control and coronary arterial thrombosis, renal diseases such as diabetic nephropathy, muscular diseases such as hypertrophy, immune disorders such as immune complex nephritis, multiple sclerosis, cancer, sarcoidosis, nonarcoidotic pulmonary granulomatous diseases such as as abbestosis and vascular pathologies involving an endothelial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               93 LVAINRTDTEYVLRTANGLFGEKSYDFLTGFTDSCGKFYQATIKQLDFVNDTEKSTTRVN 152

The sequence represents an angiotensin converting enzyme splice variant CC (ACEV) polypeptide. The polypeptides of the invention include variants of granulocyte colony stimulating factor receptor, glucagon, interleukin 6, platelet-derived endothelial cell growth factor, cyclin-dependent kinase inhibitor 1C, cellular tumour antigen PS3, and vasoactive intestinal colypeptide receptor 2. The polypeptides and their associated nucleic colypeptide receptor 2. The polypeptides and their associated nucleic condidate compounds capable of binding the molecules. The sequences of the invention can be used in the treatment and diagnosis of various consortable infarction and coronary arterial thrombosis, renal diseases contain infarction and coronary arterial thrombosis, renal diseases uch as diabetic nephropathy, muscular diseases such as hypertrophy, immune disorders such as immune complex nephritis, multiple sclerosis, cancer, sarcoidosis, nonarcoidotic pulmonary granulomatous diseases such as asbestosis and vascular pathologies involving an endothelial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   93 LVAINRIDTEYVLRTANGLFGEKSYDFLTGFIDSCGKFYQATIKQLDFVNDTEKSTTRVN 152

                                                                                                                Novel polynucleotide encoding thrombin inhibitor polypeptide useful for diagnosis and treatment of diseases related to thrombosis -
                                                                                                                                                                                                                     The present invention relates to a thrombin inhibitor. This is useful for diagnosts and treatment of thrombosis, neurodegenerative diseases such as Alzheimer's disease and Parkinson's disease, tumor metastasis, to prevent proximal extension of deep venous thrombosis or the recurrence of pulmonary embolisms and also to treat risk patients who have congestive heart failure, acute myocardial infarction or cardiomyopathy to prevent the development of deep vein thrombosis or pulmonary embolism. The thrombin inhibitor is also useful for excepting chemical compounds that either up or down regulate its
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    93 LVAINRIDIEYVLRTANGLFGEKSYDFLTGFTDSCGKFYQATIKQLDFVNDTEKSTTRVN

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequence represents an angiotensin converting enzyme splice variant (ACEV) polypeptide. The polypeptides of the invention include variants of granulocyte colony stimulating factor receptor, glucagon, interleukin 6, platelet-derived endothelial cell growth factor, cyclin-dependent kinase inhibitor IC, cellular tumour antigen P53, and vasoactive intestinal polypeptide receptor 2. The polypeptides and their associated nucleic candidate compounds capable of binding the molecules. The sequences of the invention can be used in the treatment and diagnosis of various myocardial infarction and coronary arterial thrombosis, renal diseases much as diabetic nephropathy, muscular diseases such as hypertrophy, muscular diseases such as hypertrophy, cancer, sarcoidosis, nonarcoidotic pulmonary granulomatous diseases such as asbestosis and vascular pathologies involving an endothelial abnormality such as deep vein thrombosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             4.
                                                                                           Novel alternative aplicing variants e.g. variant of angiotensin converting enzyme (ACEV), useful in identifying candidate compounds capable of binding to the variant and to detect anti-variant antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         LVAINRIDIEYVLRTANGLFGEKSYDFLIGFIDSCGKFYQATIKQLDFVNDTEKSTTRVN 152

New thrombin inhibiting proteins for treating or preventing thrombosis-related diseases, e.g. embolism, tumor metastases, carcinoma, neurodegenerative diseases, e.g. Alzheimer's or Parkinson's

Claim 2; Column 17-20; 19pp; English

cc ints invention describes a novei numan tircumbin initiation will make througholytic, cardiant, cytostatic, nootropic, neuroprotective and antiparkisonian activity and can be used for gene therapy. The thrombin continuous may be used therapetrically or diagnostically to treat or inhibitor may be used therapetrically or diagnostically to treat or continuous thrombosis of the recurrence of pulmonary embolisms and continuous thrombosis of the recurrence of pulmonary embolisms and continuous thrombosis of the recurrence of pulmonary embolisms, to treat high risk patients, e.g. those who have congestive heart failure, acute myocardial infarction or cardiomyopathy to prevent the development of deep vein thrombosis or pulmonary embolism, and as long term therapy for occasional continuous transferin may also be used for treating thrombic disease, tumor metastases, carcinoma of the brain, liver, lung, bone and neoplasmic clotherapets or Parkinson's disease). It can also be used against clotherapets or Parkinson's disease). It can also be used against clother control antibodies. The thrombin inhibitor can be used as producing antibodies. The thrombin inhibitor can be used as pharmaceutical to mammals, such as humans, mice, rats, hamster, dogs, contained the contained of the thrombin inhibitor can be used as the pharmaceutical to man and the contained of the thrombin inhibitor may be used as the thrombin inhibitor may be used as the thrombin inhibitor may be used as the thrombin and antibodies. The thrombin inhibitor can be used as the pharmaceutical to man and the contained and the produces clotheraped the pharmaceutical to man and the pharmaceutical to man and the pharmaceutical to man and the pharmaceutical to man and the pharmaceutical to man and the pharmaceutical thrombin inhibitor may be used as the pharmaceutical thrombin the pharmaceutical thrombin the pharmaceutical thrombin the pharmaceutical thrombin the pharmaceutical thrombin the pharmaceutical thrombin the pharmaceutical thrombin the pharmaceutical thromb This invention describes a novel human thrombin inhibitor which has used as diagnostic probe, for chromosome identification. 8  $\times$  9
